SURGICAL PATHOLOGY REPORT

Specimen

Gall bladder with gall stones.

Gross

Received an already cut-open specimen of gall bladder measuring 6x2x1 cm. The external surface appears shiny. On cut-opening longitudinally, the inner surface reveals smooth, velvety, greenish mucosa with focal ulcerations. The fundus reveals presence of bile along with multiple, grey-yellow, firm stones aggregating to 2.5x2x0.5 cm. No polyps, solid areas or papillary excrescences are noted.

Microscopy

Sections studied show a tissue lined by tall columnar epithelium to flattened epithelium. The subepithelial shows areas of fibrosis and mild to moderate diffuse infiltration by lymphocytes, plasma cells and macrophages. Congested blood vessels are also seen.

Impression

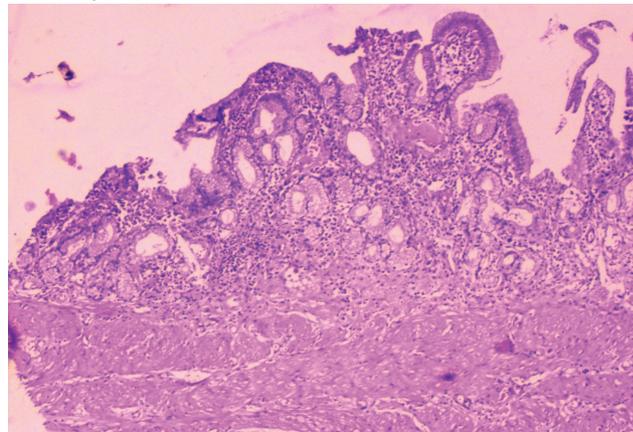

CHRONIC NONSPECIFIC CHOLECYSTITIS WITH CHOLELITHIASIS - GALL BLADDER.
